bird recently described by Taczanowski as *T. sclateri*, and is probably inseparable from that species.

Guatemalan specimens exhibit considerable diversity in the number of the black spots of the under plumage, some having the throat pure white, which in others is spotted like the breast. The example from Northern Yucatan shows the greatest divergence, being of a much greyer cast of plumage above, especially on the tail.

**B. Thryothorus.**

*Uropygium maculis celatis albis notatum.*

c. *Rostrum mediocre.*

5. **Thryothorus felix.** (Tab. VII. fig. 1.)

Supra murino-fuscescens, pileo antico rufo; loris et capitis lateribus albo nigroque striatis; alis dorso concoloribus, cauda nigrascenti regulariter transfasciata; subus cinnamonee-rufescens, ventre medio albicante, gutturo albo, crisseo albo nigro transfasciato; rostri maxilla nigrante, mandibula et pedibus plumbis. Long. tota 5-5, alae 2-4, caudae 2-6, rostri a rictu 0-9, tarsi 0-9. (Deser. exempl. ex Oaxaca, Mexico. Mus. nostr.)

*Hab.* *Mexico*, Mazatlan (Grayson ²), Juquila (Boucard ¹).

M. Boucard discovered this Wren in May 1859 in the Mexican State of Oaxaca ¹; and it has since been traced as far north as Mazatlan ², one of *M. Boucard*’s specimens having been compared with another from the latter place, and pronounced by Prof. Baird to agree in all essential respects ³.

Nothing is recorded of the habits of this Wren; but it may be assumed to resemble in this respect the following species, as Grayson’s note on *T. lawrencii* was made under the supposition that the birds of the Tres Marias Islands and Mazatlan were identical, which is now proved to be not absolutely the case. We have figured one of Boucard’s Oaxaca specimens, the same as the one which furnished Prof. Baird with his description of the species in the ‘Review of American Birds’ ¹³.

6. **Thryothorus lawrencii.**

*T. felici affinis, sed corpore subus fere albo, hypochondriis vix rufescents tinctis differt; supercilii distinctis albis, genis immaculatis albis, et rostro gracilibre magis incugo quaeque diversus. Long. tota 5-3, alae 2-3, caudae 2-2, rostri a rictu 0-9, tarsi 0-9. (Deser. exempl. typ. ex ins. Tres Marias, Mexico. U.S. Nat. Mus. no. 50818.)

*Hab.* *Mexico*, Tres Marias Islands (Grayson ¹³).

Grayson ³ describes this Wren as a little larger than the one of the mainland, but with similar notes. He adds that it is very common in the Marias, where it is a
