Sat latus, subdepressus, niger, elytris, antennis pedibusque rufis, his femoribus piccis; capite prothoraceque
densissime fortius punctatis, hoc canaliculato; elytris crebre punctatis.
Long. 5½ millim.

Hab. MEXICO, Chalchicomula (Sallé).

This insect is broader than N. mexicanus, and is remarkable for the excessive close-
ness of the coarse thoracic punctation; the head also is very closely and coarsely
punctate, but not quite so densely as the thorax. In other respects the unique example
agrees with N. mexicanus.

7. Neomedon flohri.
Subdepressus, niger, nitidus, antennis rufis, pedibus piccis, tibis tarsisque rufis; capite prothoraceque dense
fortiter punctatis, hoc medio linea levigata angusta, medio obsolete canaliculata; elytris crebris fortiter
punctatis.
Long. 5½ millim.

Hab. MEXICO, Las Vigas (Flohr).

This species, also, is closely allied to N. mexicanus, but is broader, and has a fine im-
punctate line on the thorax; the head is considerably larger, and the elytra are broader
and shorter and quite black. The male has a small angular notch at the apex of the
last ventral plate.

8. Neomedon nigricans.
Sat latus, subdepressus, niger, nitidus, antennis palpisque fusco-rufis, pedibus fusco-nigris, tarsis testaceis
capite prothoraceque crebris fortiter, elytris dense subrugulose, punctatis; prothorace medio canaliculato;
tarsis anterioribus parum dilatatis.
Long. 5½ millim.

Hab. GUATEMALA, Capetillo (Champion).

Exceedingly similar to N. flohri, but undoubtedly distinct on account of the slight
dilatation of the front tarsi; the elytra, too, in the present species are more densely
punctate. The male has a slight emargination of the last ventral plate.

Four examples.

Sat latus, subdepressus, nigricans, antennis pedibusque fusco-rufis; capite presertim fortius densiusque
punctato, prothorace crebris fortiterque punctato, medio linea angusta levigata, obsoletius canaliculato;
elytris crebre fortiterque punctatis; tarsis anterioribus parum dilatatis.
Long. 5½ millim.

Hab. MEXICO, Mirador (Höge); GUATEMALA, San Gerónimo (Champion).

This insect has a large broad head, remarkable on account of its very dense and
coarse punctation; the sculpture of the head and thorax readily distinguishing the
