17. Cephaloleia discoidalis.
Subelongata, pieca, nitida; pedibus fulvis; scutello, epite thoraceque nigris, hoc sat crebre punctato, apice angustae pieco-fulvo; elytris oblongis, sat forterior punctato-striatis, sordide fulvis; vitta suturali, postice angustata, pone medium fere obsoleta, alteraque discoidali, brevi, pone medium posita, nigris, instructis.
Fem. Abdominis segmento anali late sed leviter transversim emarginato.
Long. 2\(\frac{1}{2}\) lin.

Hab. MEXICO, Orizaba (Sallé). A single specimen.

Head very closely punctured. Basal joint of the antennæ longer than the second, slightly thickened, second and third nearly equal in length (the rest wanting). Thorax slightly broader than long; sides straight and parallel, anterior angle produced into an obtuse tooth; disc transversely convex, more strongly but less closely punctured than the head. Elytra broader than the thorax, oblong; sides subparallel, their apices obtusely rounded; above moderately convex, slightly excavated and sinuate on the side below the humeral callus; surface rather strongly punctate-striate; the sutural vitta, commencing at the basal margin and dilated just below the scutellum, is from thence gradually narrowed to a short distance below the middle of the elytron, where it terminates in a narrow line which runs along the suture nearly to the apex.

18. Cephaloleia dorsalis.
Anguste oblongo-ovata, nitida, subtus pieco et nigro variegata; abdomine pedibusque flavis, tarsis pieco tinetis; supra nigra, thorace subeylindrico, subcrebro punctato; lateribus reellis, ad apicem anguste piecis; elytris oblongis, apice rotundatis, modice convexis, sat forterior punctato-striatis, vitta suturali subuneiformi a basi ad medium extensa, basi angustata, nigra, ornatis.
Mas. Abdominis segmento anali apice late emarginato, medio sinuate.
Fem. Abdominis segmento anali apice truncato utrinque sinuate.
Long. 2–2\(\frac{1}{2}\) lin.

Hab. PANAMA, Bugaba 800 to 1500 feet (Champion).

Front between the eyes closely punctured. Antennæ filiform, more than half the length of the body. Thorax slightly broader than long; sides straight and parallel; disc subeylindrical, rather strongly punctured. Elytra oblong, moderately convex, rather strongly punctate-striate.

19. Cephaloleia histrionica. (Tab. I. fig. 21.)
Oblongo-elongata, nigra, nitida; pedibus flavis, coxis, genibus tarsisque nigris; thorace quam longo vix latiori forterior punctato, flavo, limbo anguste plagaque basali magna nigris; elytris punctato-striatis, flavis, basi rufo-testaceis, vittis tribus, dubius externis basi abbreviatis, nigris, instructis.
Mas. Abdominis segmento anali late transversim emarginato, medio leviter sinuate.
Fem. Abdominis segmento anali leviter emarginato.
Long. 2–2\(\frac{1}{2}\) lin.

Hab. PANAMA, Bugaba, Volcan de Chiriqui 2000 to 4000 feet (Champion).

Front clothed with adpressed fulvous hairs. Antennæ filiform, first and third joints nearly equal in length, the second rather shorter. Thorax rather broader than long;
