13. **Clastoptera flavifrons.** (Tab. XII. fig. 28.)

*Hab.* MEXICO (coll. Signoret, in Mus. Vind. Cæs.).—Brazil.

This is a small, oblong, brownish species, with the head, pronotum, and scutellum of a yellowish colour; structurally it closely resembles one or two allied forms, and may be only a variety of one of them. The species from Mexico in the Vienna Museum is figured.

14. **Clastoptera rufescens**, sp. n.

Parva, nitida, capite, pronoto, scutelloque rufescensibus, metopidio ad medium testaceo utrinque transversim rufo-fusco testaceoque lineato; pronoto sat fortiter transversis lineis impresso, antice testaceo-marginato; tegminibus nitidissimis, hyalinis, sat fortiter punctatis, venis rufescensibus, callis nigris, distinctis; corpore subtus negro; pedibus rufo-testaceis.

A small shining species, with the head, pronotum, and scutellum rufescent; pronotum rather strongly impressed with rugose lines, the anterior margin testaceous; tegmina shining and transparent, rather strongly punctured, with the veins rufescent and without markings, the subapical callositics very distinct, black; abdomen black; legs rufo-testaceous.

*Hab.* MEXICO, Chilpancingo in Guerrero 4600 feet (H. H. Smith).

This species appears to be allied to the North-American *C. xanthocephala*, Germ., which is, however, a darker and less shining and transparent insect.

We have also received a specimen from Teapa in Tabasco, which I at first referred to this species, but it is rather larger, with a fuscous patch at the margin of the tegmina and very small testaceous apical callositics.

15. **Clastoptera unicolor**, sp. n.  (Tab. XII. fig. 29.)

Oblonga, parva, postice nonnullis dilatatà, sordide testaceâ, nonnullis nitidà, pronoto vix transversim lineis impresso; tegminibus plus minusve distincte, interdum sat fortiter, punctatis, callis modicis, nigris, distinctis; pedibus testaceis.

A small, oblong species, more or less dilated behind, of a uniform dirty testaceous colour (occasionally reddish), with the pronotum faintly impressed with transverse lines, and the tegmina (especially the clavus) more or less distinctly punctured; legs testaceous; underside somewhat pitchy.

*Hab.* MEXICO (Bilimek, in Mus. Vind. Cæs.), Vera Cruz (H. H. Smith); GUATEMALA, San Gerónimo (Champion).

This insect appears to be inseparable from *C. arkansasensis*, Fitch, in litt., and is also allied to *C. rufescens* and *C. xanthocephala*, Germar, as well as to *C. testacea*, Fitch; the last-mentioned species is longer, and differs in several particulars.

A specimen from Vera Cruz is figured.
