

14. **Mesosemia lepida**, sp. n. (Tab. XLIII. fig. 3.)

*M. lagora* proxima, sed posticis ocello submarginali haud notatis forsitan distinguenda.

Hab. PANAMA, Bugaba (*Champion*).

It is perhaps doubtful if this insect will ultimately prove distinct from *M. lagora*. We have six specimens of it, none of which have any indication of an ocellus or black spot near the middle of the outer margin of the secondaries on the upper side.

15. **Mesosemia molina**, sp. n.

*Mesosemia lagora*, Hew. Ex. Butt., Mesosemia, t. 3. f. 20 (nec Herr.-Sch.)<sup>1</sup>; Butl. & Druce, P. Z. S. 1875, p. 352<sup>2</sup>.

*M. lagora* quoad paginam superiorem proxima, sed subtus anticis ocello cellulari facile distinguenda.

Hab. NICARAGUA, Chontales (*Belt*); COSTA RICA (*Van Patten*<sup>2</sup>), Irazu (*Rogers*); PANAMA, Lion Hill (*M'Leannan*).—COLOMBIA<sup>1</sup>; ECUADOR; GUIANA.

This species, which Hewitson figured as *M. lagora* from Colombian examples, is easily to be distinguished from that insect by the presence of a very distinct ocellus on the primaries beneath, which, in some examples, shows through to the upper side, as indicated in Hewitson's plate.

It is perhaps one of the commonest forms of this section of *Mesosemia* as far north as Nicaragua.

16. **Mesosemia nivalis**, sp. n. (Tab. XLIII. fig. 4.)

*M. lagora* quoque similis, sed alis candidissimis lineis fuscis angustissimis, anticarum margine externo haud fusco, et ocellis in pagina superiore nullis distinguenda.

Hab. MEXICO, Jalapa (*H. Edwards*); GUATEMALA, Polochic valley (*Hague*), Panima, Zapote, Pantaleon, Las Mercedes, San Isidro (*Champion*); NICARAGUA, Chontales (*Belt*).

This is much the whitest of these *Mesosemia* in our region, being even whiter than *M. vestalis*.

The submarginal ocelli of *M. lagora* are just indicated by black spots on the under-side; but on the upper side they are not visible. There is no ocellus in the cell of the primaries, and in this respect *M. nivalis* differs from *M. vestalis* and *M. molina*.

At San Isidro it is found in the cacao-plantations (*Champion*).

Two other species allied to *M. nivalis* are represented in our collection by a good series of specimens. They are described below \*.

\* **Mesosemia nivea**, sp. n.

*M. nivalis* similis quoad paginam superiorem sed lineis fuscis aliquot latioribus; subtus alis macula ad cellulæ finem nigra, et posticis punctis submarginalibus nigris distinguenda.

Hab. BOLIVIA (*Buckley*); BRAZIL, Minas Geraes, Espírito Santo.

*Mus. nostr.*
