Machine No. 112 w 115 has two needles and two belt driven rotary hooks, and is designed for simultaneously making two parallel rows of lock stitching in the manufacture of corsets, cloaks and jackets, jean pants, overalls, mackintoshes and clothing generally. The distance between the needles may be from \( \frac{3}{8} \) to 1\( \frac{1}{2} \) inch as desired, and orders for the machine should specify the gauge required.

The output of work by this machine is entirely dependent upon the skill of the operator as the machine can be driven continuously at the high speed of 3000 per minute, which on some grades of work is much faster than operators can handle the goods. A clear working space of 10\( \frac{1}{2} \) inches at the right of the needle enables operators to easily handle large work.

Although this machine can be driven continuously at high speed per-
fect lock stitching is accomplished. This is made possible by the improved construction of the stitching mechanism of the machine which positively ensures uniform stitches alike on both sides of fabrics. Manufacturers therefore find Machine No. 112 W 115 of inestimable value as it meets their stitching requirements in the most satisfactory manner both as regards quantity and quality of work.

The machine has an efficient compound feed which consists of a combination of drop feed and needle feed. After the needles have entered the fabric, the needles and feed in unison move the work forward so that the feeding is perfectly accomplished, and two or more plies of fabric will be flat when stitched and without a tendency to roll.

The length of stitch is regulated by means of a thumb screw conveniently located at the right of the balance wheel, and stitches varying in length up to seven to the inch can readily be made.

All operating parts of the machine are hardened and ground and the bearings are bushed throughout, thus rendering the machine capable of continuous satisfactory service at a minimum charge for maintenance.
