

1. **Tirista argentifrons.** (Tab. V. fig. 14.)

Tirista argentifrons, Walk. Cat. xxxi. p. 22.

Hab. MEXICO, Oaxaca (*Sallé*).

The type of this species and the only specimen known to me is in the British Museum.

SINCARA.

Sincara, Walk. Cat. viii. p. 61 (1856).

This genus was founded by Walker for the reception of an insect sent home by Mr. Bates from Para. It is allied to *Melittia*, from which it differs in its more robust form and short thick antennæ, also in its being without the hair on the hind legs.

1. **Sincara phyllis**, sp. n. (Tab. V. fig. 18.)

Primaries slightly hyaline, brownish yellow at the base, the costal and inner margin orange-yellow; secondaries hyaline, the fringe brown: head, thorax, and abdomen blackish brown, the front of the thorax slightly yellow, the third segment of the abdomen yellow; palpi and collar yellow; antennæ black, yellowish at the base; legs brown. Expanse $1\frac{1}{4}$ inch.

Hab. GUATEMALA, Cerro Zunil (*Champion*).

I have only received a single specimen of this insect, in very poor condition, and do not feel certain about the yellow markings on the thorax and abdomen.

2. **Sincara cambyes**, sp. n. (Tab. V. fig. 19.)

Primaries whitish hyaline, the costal margin and apex black; secondaries hyaline, the outer margin and fringe slightly black: head, thorax, and abdomen black; antennæ and legs black, the tarsi speckled with a few yellowish hairs. Expanse $\frac{2}{5}$ inch.

Hab. PANAMA, Bugaba (*Champion*).

A small species, of which only a single specimen has been sent. It closely resembles typical *Ægeria*, excepting its short thick antennæ, which are characteristic of the genus *Sincara*.

3. **Sincara lytæa**, sp. n. (Tab. V. fig. 20.)

Primaries hyaline, yellowish near the base; the costal margin and apex slightly brownish black; secondaries hyaline, the fringe brown: head, thorax, and antennæ black; palpi greyish white below, above black; abdomen black, each segment banded with white, the anal tuft greyish white; legs black, speckled with a few white hairs. Expanse $\frac{3}{4}$ inch.

Hab. GUATEMALA, Zapote (*Champion*).

Only one example of this curious little species appears to have been taken.

SANNINA.

Sannina, Walk. Cat. viii. p. 63 (1856).

Four species of this genus have been described by Walker—one from North America, BIOL. CENTR.-AMER., Heter., Vol. I., June 1884.
