

suture, and the other parallel to it on the disc of the corium), green, the apex not hyaline; underside light testaceous; legs testaceous, in part fuscous.

Long. 9 millim.; lat. 2 millim.

Hab. GUATEMALA, Cerro Zunil (*Champion*).

This is a very distinct species; at first sight it has a dark and obscure appearance, but viewed under a lens the coloration is very striking.

121. *Tettigonia cæruleovittata*.

Tettigonia lineata, Sign. Ann. Soc. Ent. Fr. 1854, p. 21, t. 2. fig. 9¹ (nec *T. lineata*, Fabr. Syst. Rhynch. p. 66).

Tettigonia cæruleovittata, Sign. Ann. Soc. Ent. Fr. 1855, p. 821 (Table des Tettigonides: correction of synonymy)².

Hab. NORTH AMERICA, United States¹.—MEXICO (*Mus. Vind. Cæs.*), Atoyac and Fortin in Vera Cruz, Teapa in Tabasco (*H. H. Smith*), Orizaba (*Sallé*; *Bilimek*; *H. H. Smith & F. D. Godman*), Cordova (*Sallé*), San Lorenzo (*M. Trujillo*); GUATEMALA, Cerro Zunil 4000 to 5000 feet (*Champion*); NICARAGUA, Chontales (*Janson*).

There is a very large series of this species in our collection. It may at once be known by the black stripes on the green ground of the tegmina, and the large and conspicuous black spot in the centre of the vertex of the head.

Var. delineata, n. (Tab. XVIII. fig. 23.)

Major, tegminibus rufo-brunneis vel brunneis, vittis cæruleis multo magis conspicuis, facile distinguenda.

Rather larger than the type-form, with the general ground-colour darker, and the elytra of a rich reddish-brown or brown colour, with very conspicuous light blue or greyish-blue stripes; the head is a little more pointed in front, but in this character the type-form varies considerably.

Long. 7–8 millim.; lat. 2 millim.

Hab. MEXICO, Cuernavaca in Morelos, Chilpancingo and Amula in Guerrero (*H. H. Smith*); GUATEMALA, Cerro Zunil (*Champion*).

At first sight the variety looks distinct, but on a close comparison it will be seen that it can hardly be separated, and one or two of the specimens from Teapa are entirely intermediate.

We figure a specimen of the variety from Cerro Zunil.

122. *Tettigonia composita*, sp. n. (Tab. XVIII. fig. 24.)

Sat robusta, nitida, apicem versus acuminata, nigro, castaneo, testaceo et interdum rufo plus minusve distincte variegata; capite brevi, triangulari, antice angulato, oculis prominulis; pronoto capite longiori, convexo, antice nonnihil angustato; tegminibus castaneo-rufis vel rufo-fuscis, testaceo lineatis et notatis, varian-tibus; abdomine supra rufo, subtus fusco; sterno pedibusque testaceis.

Rather shiny, narrowed towards the apex; head short, triangular, with the vertex plainly angled, variegated with testaceous and rufous-brown, and with dark markings in front, eyes a little prominent; pronotum convex, narrowed in front, with dark lines bordered by testaceous and rufous-brown longitudinal bands; scutellum similarly coloured to the pronotum; tegmina dark red or castaneous-red, with the margins and
